IMAGELAB	Title	ImageLab Progress Report Week 3
	Course	CMPS4191 Advanced Web Technologies
	Semester	2026-1
	Due Date	Sep 23, 2026

Progress Summary

The third week primarily involved polishing the frontend UI codebase and ensuring that short polling was properly implemented. Some parts of this week's work were done in previous weeks, since the foundation was particularly useful for testing and verification of other requirements.

Completed tasks included:

- Implementation of the AbortController as a way to manually cancel any current polling operation, as well as safeguarding the case of page shutdown. This involved an additional state variable, extra logic in the data service's polling fetch to include a signal, and calls to the appropriate event emitters in order to manage polling.
- Refactoring and bugfixing of the frontend UI codebase.
- Verification of short polling, its interval, and UI updates.
- Verification of stopped polling on completed and failed job statuses.
- Verification of retrieval error and repolling logic for the Check Status button (implements the Try Again).
- Experimentation with using a Justfile as a Makefile alternative.

No requirements for the Week 3 Check-in were incomplete. At this point, no other requirements should be blocked. Week 4 will entail implementing the required measurements, testing, review, and documentation.

One uncertainty regarding this week involves the AbortController. It was a requirement whose significance was particularly difficult to grasp, since visual evidence of its operation was limited. Nevertheless, it plays an important role in handling cases where polling requests need to be aborted, and it is implemented in the necessary areas (e.g., during page shutdown with a beforeunload event listener on the browser window or when canceling the current polling operation).
